

Do you have on-demand, up-to-date information on your emergency patients identity? Do you have to retrieve patient data from your software manually? Could you benefit from a system that prints wristbands automatically? Are you sometimes duplicating patient data entry in your emergency department? Would you like to have an easy add on solution for bioPoint PI to simplify and accelerate your patient check-in workflow?

The bioPoint™ PI Emergency Room Interface (EI) module is a bioPoint PI add-on module that is designed to provide the automatic wristband printing of an emergency room or urgent care admission. The EI module eliminates the need of duplicating data entry that is currently required to print an emergency department patient wristband. This will help you to drastically improve your patient check-in processes.

Features

- Automatic download processes of emergency department patient information through bioPoint PI
- Demographic information, any available VIC ID photo, and all documented allergy or ADR data are included
- Automatic printing of patient wristbands or wristband/chart label combos
- Patients are added to the bioPoint patient list automatically
- Download processes are initiated when EDIS assigns a triage nurse; or a VistA ED appointment is created for the patient
- Your current bioPoint installations will retain all of the configured capabilities including the ability to utilize the walk-up feature and selection of other hospital wards for patient review and printing

Streamline your workflow, accelerate your patient check-in and improve patient data accuracy and availability at any time with bioPoint PI and the EI module.
